

ARE YOU USING AIRBAGS FOR YOUR CARTRIDGES?

By Mike Josiah and the Technical Staff at UniNet

Airbags are now available for just about every cartridge type in the market, and these come in multiple styles; re-usable and heat-sealed, all in many sizes in both black and clear bags to fit just about every cartridge in the market perfectly.

Airbags are used by the OEMs more and more as they deliver the utmost protection for a cartridge.

Airbags work by using a series of connected air-inflated tubes, which insulate the cartridge with a cushion of air and protect it from damage, thus lowering your defect rate from shipping or delivery damages. Airbags can be inflated quickly and easily with a small compressor.

The end-user can easily open the heat-sealed bags with a built in tear strip. The reusable bags fold open and can be used multiple times.

Simple instructions for both types of bags are available on the UniNet Web site at:
